Introduction

Purpose of this Document

The purpose of this document was to provide an insight as to how we proceeded in creating the diagrams required for the group project we had been assigned to do. This document will present to you all the information, from descriptions to designs, which "Group 15" had created in regards to the design aspect of this project.

Scope

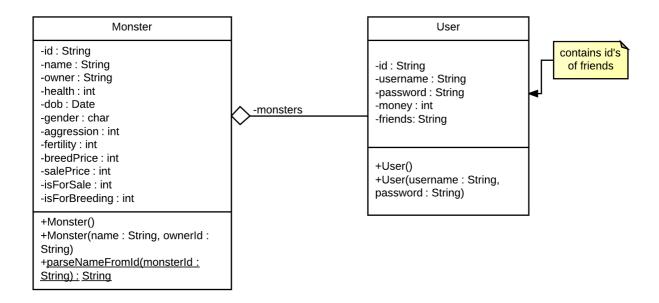

This document shows all the diagrams, methods and descriptions regarding the design factor of this project. It reveals how the diagrams all inter-link to each other from the server side to the design. The descriptions of the classes used are clearly explained in this document, as well as the methods we had used, to give you an understanding of how we progressed in this assignment.

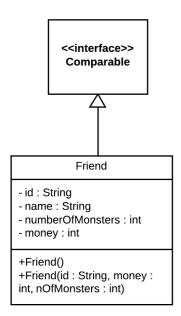

Objectives

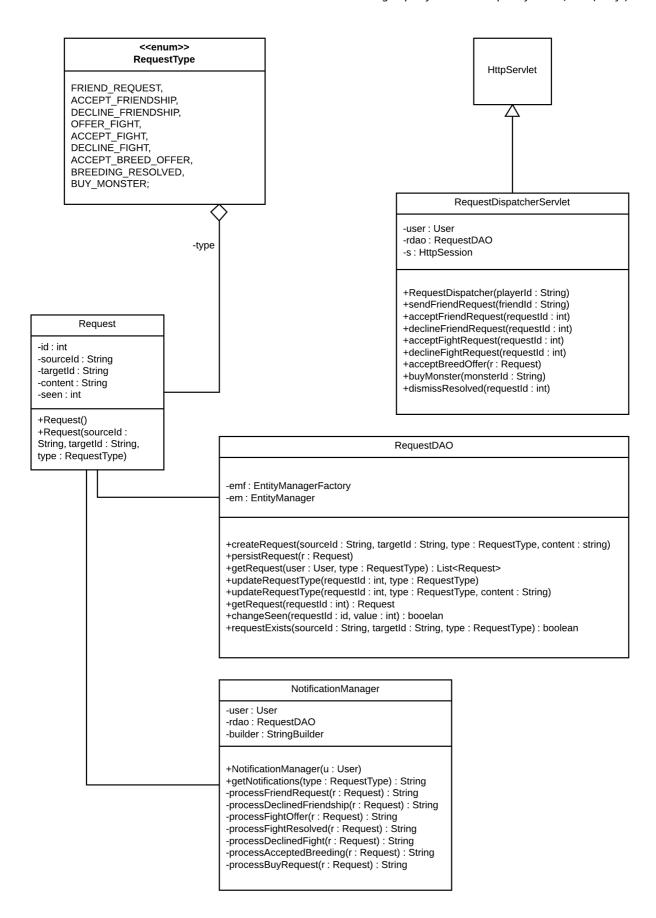

The priority objective for the design team was to create the necessary resources for the application to the point that it worked efficiently, as well as having an impressive appearance. The software structure, components, interfaces and the data revolving around the design factors would all have to be drawn up and created by the team ensuring it meets the requirements of the group as a whole.

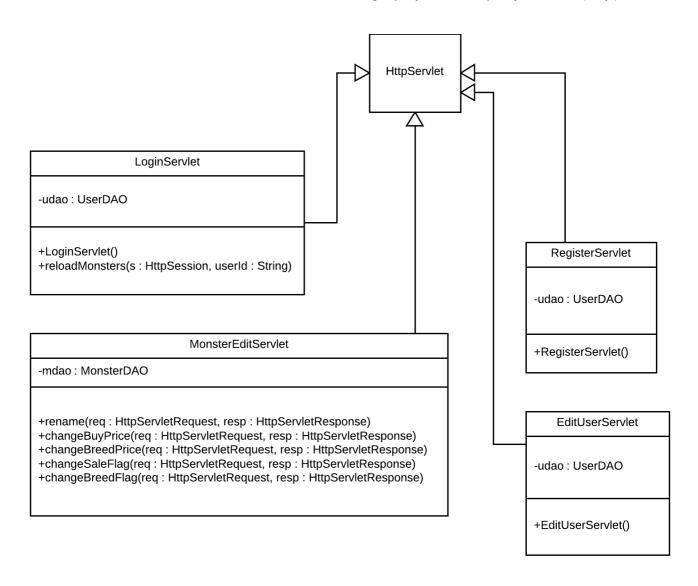

Decomposition Description

Class Diagram

UserDAO -emf: EntityManagerFactory +userExists(userId : String) : boolean +usernameExists(username: String): boolean +loadMonsters(ownerId: String): List<Monster> +getMonstersForBreeding(ownerId : String) : List<Monster> +getMonstersForSale(ownerId : String) : List<Monster> +countMonsters(user : User) : int +createUser(uname : String, pass : String) : boolean +authenticateUser(username : String, password : String) : User +getFriends(u : User) : ArrayList<Friend> +checkFriendship(userIdOne: String, userIdTwo: String): boolean +addFriendship(userIdOne: String, userIdTwo: String): boolean +updateUser(username : String, password : String) : boolean +changeMoney(user: User, value: int): boolean +reloadUser(userId: String): User +deleteUser(user : User) +removeFriendship(friendIdOne : String, friendIdTwo : String) : booelan

MonsterDAO

- childPercent: int - maturePercent : int -emf: EntityManagerFactory -em : EntityManager Validator +persistMonster(m: Monster) - r: Random +findMonster(monsterId: String): Monster +renameMonster(monsterId: String, newName: String) +generateMonster(userId: String, monsterName: String): Monster +changeOwner(monsterId : String, toUserId : String) + toMD5(s: String) : String +changeBreedPrice(mld: String, price: int) + rand(low: int, high: int): int +changeBuyPrice(mld : String, price : int) +changeBreedFlag(mld: String, flag: boolean) +changeSaleFlag(mld: String, flag: boolean) +ageMonsters(monsters: List<Monster>) +age(monster: Monster) +calculateDaysDifference(start : Date, end : Date) : int +calculateDaysDifference(start : Date) : int +fight(monsterOne: Monster, monsterTwo: Monster): Monster +calculatePrize(monster: Monster): int +wipeMonster(id : String) +updateHealth(monsterId: String, health: int) +breed(monsterOne: Monster, monsterTwo: Monster): List<Monster> +changeRequestMonsterId(fromId : String, toId : String)

Class Description

Monster – This class contains the attributes of the monster and methods to set monsters for breeding or for sale.

User – This class contains the details of the user, including username and password required to log them in. It also contains variables for the amount of money they have and their list of friends. It contains methods to set the password, get money (when account is created, by winning fights, selling, buying and breeding monsters), adding friends and deleting friends, adding monsters (by buying or breeding) and deleting monsters (when they lose fights or die of old age).

UserDAO/User – These classes manages the user accounts. It contains methods to create an account, remove an account, reset an account and authenticate the user and contains methods to obtain data from the server

Monster DAO/Monster – These classes manages all methods when fetching and manipulating data from the database. It has certain functions, which are vital to the monsters fighting statistics, such as age(), but then also has certain methods for fighting and breeding monsters.

RequestDAO/Request – These classes manage all data manipulation when it comes to finding, creating or deleting requests from the database, and assigning them to different Users/Monsters

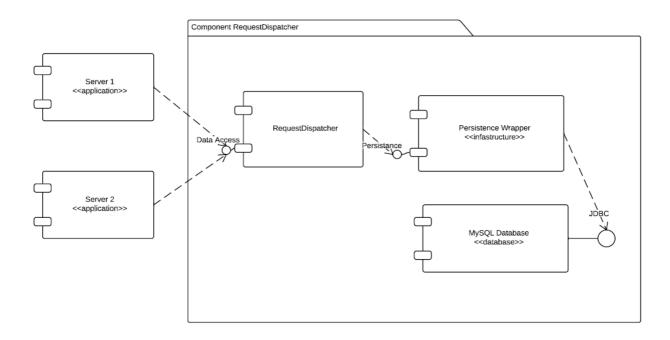

RequestDispatcherServlet – handles all input for setting up requests for monsters to fight/breed or be sold, while also serving as a point for users to add friends. It has been designed in such a manor that a simple layer on top to parse JSON is only needed for manipulating incoming/outgoing data.

Mapping from requirements to Classes

Requirement	Classes providing requirement
FR1	AccountManager
FR2	DataManager, Friend
FR3	User, DataManager
FR4	RequestDispatcher, FightRequest, FightResolver
FR5	RequestDispatcher, Request
FR6	AccountManager, User, Monster
FR7	AccountManager, User, index.jsp
FR8	JSP pages
FR9	RequestDispatcher, friends.jsp
FR10	FightResolver, FightRequest, fight.jsp
FR11	DataManager
EIR1, PR1, PR2	JSP Pages

Dependency Description

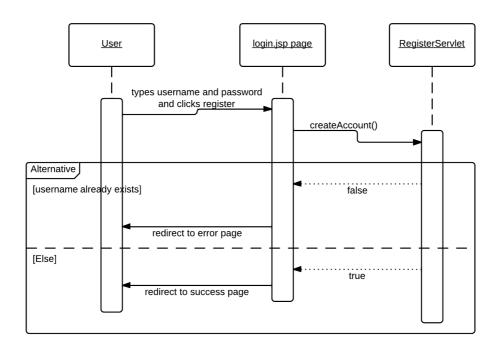

Component Diagrams

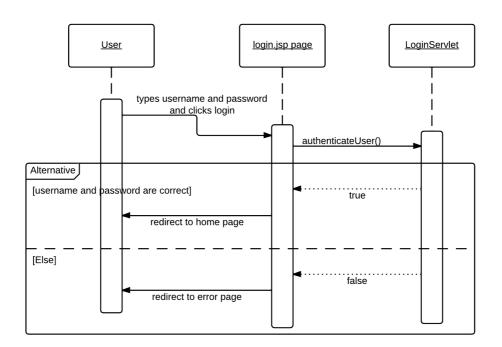

Detailed Design

Sequence Diagrams

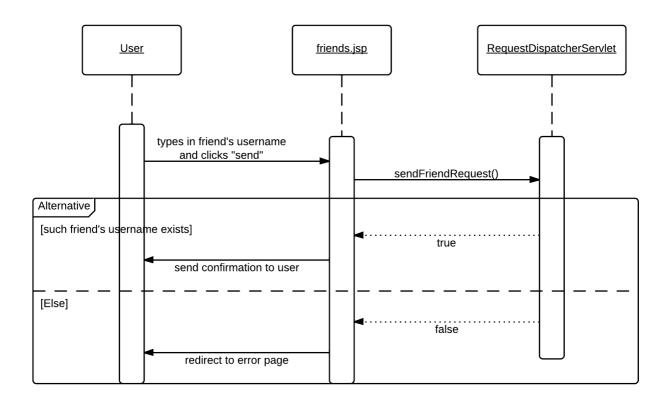

Registering new user

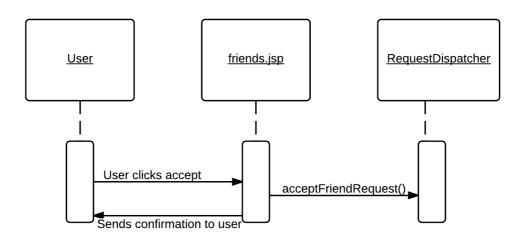

log user in

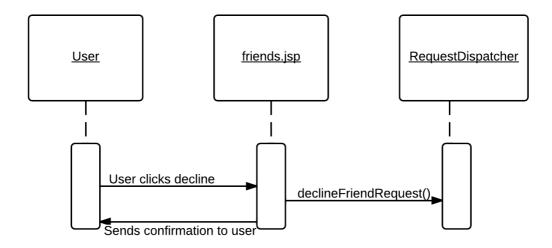

adding a friend

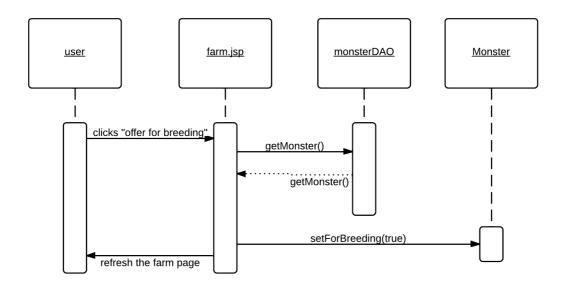

Accepting Friend Requests

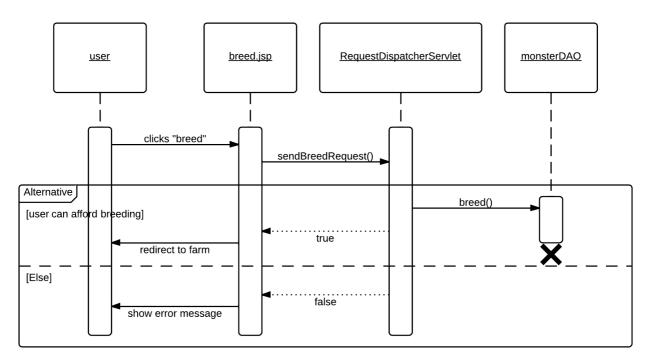

Declining Friend Requests

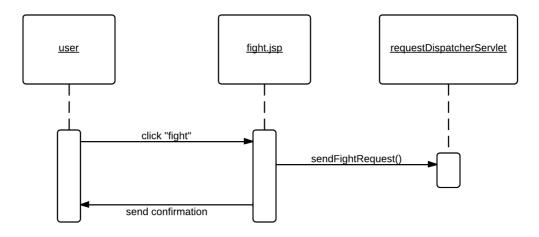

Offering monster for breeding

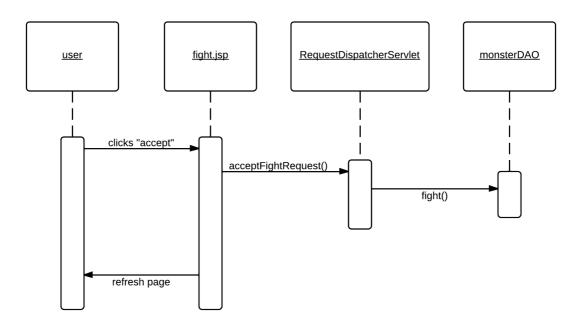

Breeding with other monster

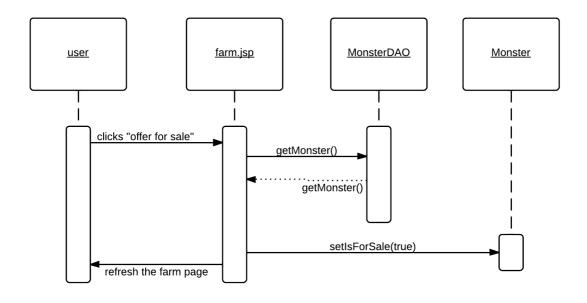

Sending fight request

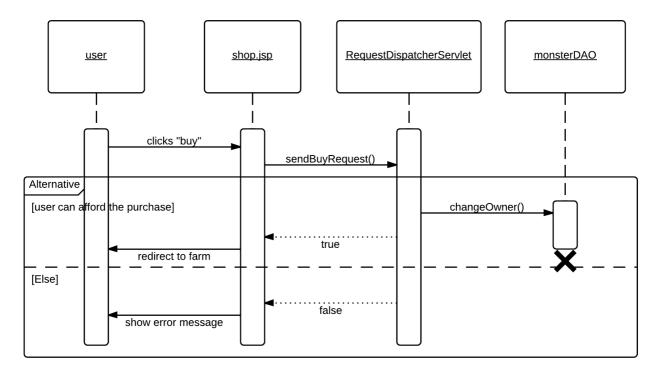

Accepting fight request

Offering monster for sale

Purchasing a monster

Change log

Version	CCF Number	Date	What Changed	User
1.0	N/a	02.12.2012	First Draft	imm5
1.1	N/a	07.12.2012	Brought up to standard.	cew10
1.2	N/a	30.01.2013	Proofread and corrections	cew10
1.3	N/A	14/02/2013	Updated with new design	Sbs1
